Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

It comprises T cell epitope regions from 2 or more different allergens (preferably linked via arginine or lysine dimers), where the T cell epitope regions: have a positivity index greater than 100 as measured in a patient group responding to the allergen; have at least 70% reactivity with lymphocytes from patients responding to the allergen; and are not reactive with immunoglobulin E (IgE) antibodies from patients responsive to the allergen. The agent can be used to prevent and treat a wide variety of allergic diseases, e.g. by desensitisation. Side effects, e.g. those mediated by IgE, are reduced.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence
The present sequence represents a mulfi-epitope peptide which is used as a new immunotherapeutic agent. It comprises T cell epitope regions from or more different allergens (preferably linked via arginine or lysine dimers), where the T cell epitope regions: have a positivity index greater than 100 as measured in a patient group responding to the allergen; have at least 70% reactivity with lymphocytes from patients responding to the allergen; and are not reactive with immunoglobulin E responding to the allergen; and are not reactive with immunoglobulin E (IgE) antibodies from patients responsive to the allergen. The agent can be used to prevent and treat a wide variety of allergic diseases, e.g. b desensitization. Side effects, e.g. those mediated by IgE, are reduced.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Claim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Multi-epitope
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AAW27371 standard; peptide; 134 AA
                                                                                                                                                                                                                                                                              Peptide immuno:therapeutic agent to treat allergic diseases contains multi-epitope peptide containing T cell epitope refrom different allergens
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                10-MAR-1996;

                                                                      The present sequence represents a multi-epitope peptide which is used as a new immunotherapeutic agent. It comprises T cell epitope regions from or more different allergens (preferably linked via arginine or lysine dimers), where the T cell epitope regions: have a positivity index greater than 100 as measured in a patient group responding to the allergen; have at least 70% reactivity with lymphocytes from patients responding to the allergen; and are not reactive with immunoglobulin E (IgE) antibodies from patients are used to prevent and treat a wide variety of allergen diseases, e.g. be desensitisation. Side effects, e.g. those mediated by IgE, are reduced.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAW27369 standard; peptide;

                                                                                                                                                                                                                                                                   The present invention describes a peptide, its complex, derivative or its polymerizate, where the peptide (I) has a formula of: alpha1-alpha2-alpha3-alpha4-alpha5-alpha6-alpha7 where alpha1 to alpha7 = amino acid sequence selected from amino acid sequences ranging from 11-19 amino acid derived from T cell epitopes derived from cedar (japanese cedar - Cryptomeria japonica) pollen allergens. The peptide can be used in an antisugipollinosis agent. AAF59011 to AAF59062 and AAB69094 to AAB69121 represent sequences used in the avantification of the present invention

                                     Cedar pollen allergen T cell epitope derived protein SEQ ID NO:13.
                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes a peptide, its complex, derivative or its polymerizate, where the peptide (I) has a formula of: alpha1-alpha2-alpha3-alpha4-alpha5-alpha6-alpha7 where alpha1 to alpha7 = amino acid sequence selected from amino acid sequences ranging from 11-19 amino acids derived from T cell epitopes derived from cedar (japanese cedar - Cryptomeria japonica) pollen allergens. The peptide can be used in an antisugipollinosis agent.

The peptide can be used in an antisugipollinosis agent. AAF59011 to AAF59062 and AAB69094 to AAB69121 represent sequences used

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   WPI; 2001-185061/19
The present invention describes a peptide, its complex, derivative or its polymerizate, where the peptide (I) has a formula of: alpha1-alpha2-alpha3-alpha4-alpha5-alpha6-alpha7 where alpha1 to alpha1 a maino acid sequence selected from amino acid sequences ranging from 11-19 amino acids derived from T cell epitopes derived from cedar (japanese cedar - Cryptomeria japonica) pollen allergens. The peptide can be used in an antisugipollinosis agent.
                                                                                                                                                                                                                                                                                                                                                                                                           Synthetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AAB69105 standard; Protein;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 in the exemplification of the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes a method for chemically synthesising a peptide by solid phase synthesis. The method comprises processing a carrier resin to which the C-terminal amino acid derivative of the target peptide has been preliminarily bonded is characterised by adding a protective group to inactivate a part of alpha-amino groups of an amino acid capable of undergoing a peptide extension reaction on the carrier resin. The method is useful for synthesising a peptide by solid phase synthesis. Long chain peptides can be readily synthesised in with a high success ratio without using the segment condensation method or gene manipulations. The present sequence represents an amino acid peptide sequence given in an example from the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match
                                                                                                                                                                                                                                                                  The present invention describes a method for chemically synthesising a peptide by solid phase synthesis. The method comprises processing a carrier resin to which the C-terminal amino acid derivative of the target peptide has been preliminarily bonded is characterised by adding a protective group to inactivate a part of alpha-amino groups of an amino acid capable of undergoing a peptide extension reaction on the carrier resin. The method is useful for synthesising a peptide by solid phase synthesis from chain marridae can be readily continued by solid capable.

                                                                                                                              Matches
                                                                                                 Query Match
                                                                                                                                                rarget peptide has been preliminarily bonded is characterised by adding a protective group to inactivate a part of alpha-amino groups of an amino acid capable of undergoing a peptide extension reaction on the carrier resin. The method is useful for synthesising a peptide by solid phase synthesis. Long chain peptides can be readily synthesised in with a high success ratio without using the segment condensation method or gene manipulations. The present sequence represents an amino acid peptide sequence given in an example from the present invention.
                                                                                                                           Sequence
                                                                                                                                                                                                                                                            The present invention describes a method for chemically synthesising a peptide by solid phase synthesis. The method comprises processing a carrier resin to which the C-terminal amino acid derivative of the target peptide has been preliminarily bonded is characterised by adding
                                                                                                                                                                                                                                                                                                                                                                                  Chemically synthesizing a peptide by solid phase synthesis by adding protective group to inactivate part of alpha amino group of an amino
                                                                                                                                                                                                                                                                                                                                          Example 5; Page 21-22; 38pp; Japanese.
